Run the Java Program
-Download IntelliJ, then open the unzipped Java program which should have everything you need to run.  OR you can use Visual Studio Code with the latest Java extension (downloadable in extensions).

JAR
-The Jar file runs org.json and it will be included in the zip file. This is needed to run JsonObject and JsonArray dependencies as well as throwing a JsonException Api (org.json imports)
-Jar is downloaded and is included as a dependency. IF it does not run with the zip file, please google org.json-chargebee-1.0.jar and download. You then unzip the file. Once you have the project on intelliJ, you take this jar file and add it as a dependency in the external library to run. If you have trouble finding the way to get the jar to work, please look at a demo for downloading and adding it here in this very short, straight to the point, video from youtube:
